

ABSTRACT OF THE DISCLOSURE

A package having a locking mechanism and reinforced cell includes first, second, and third panels, wherein the first and third panels are foldable over each other. The reinforcing cell is defined by at least one flap of the third panel folded to have an edge engage an interior surface of the first panel. The locking mechanism is provided by an upper edge of the second panel being engaged by a top edge of the first panel. A push button provided on the second panel is used to disengage the locking mechanism.
